User Manual - Amna Ashraf

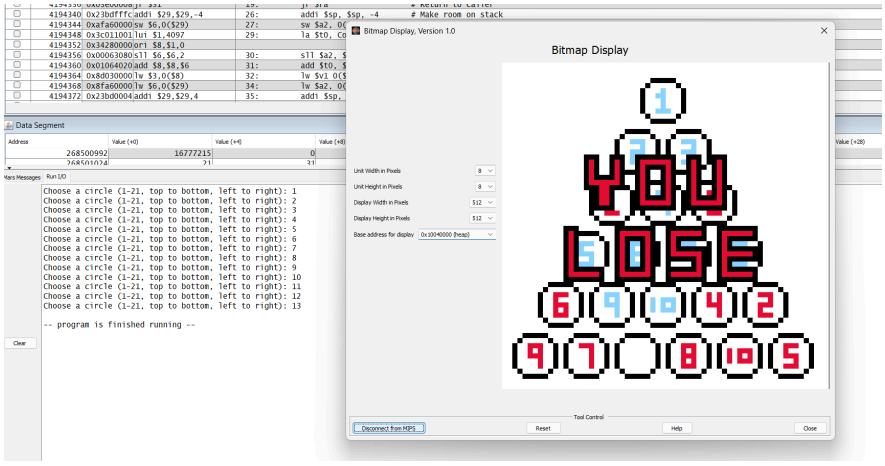

How to Run:
Only main.asm needs to be compiled and executed. Other files (DrawFunctions.asm, Graphics.asm, HandleWinner.asm, SysCalls.asm) must be present within the same directory as main.asm

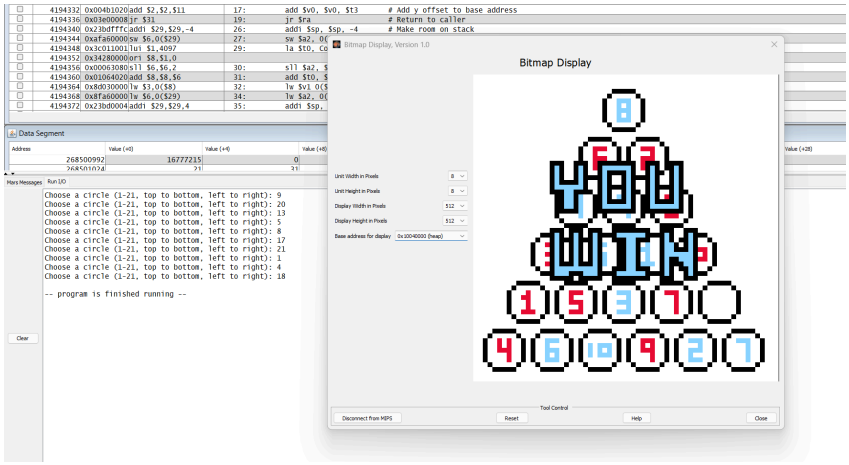

Setup:
Before executing the program, configure the Bitmap tool (Tools -> Bitmap Display). Copy these settings:
Unit Width in Pixels: 8
Unit Height in Pixels: 8
Display Width in Pixels: 512
Display Height in Pixels: 512
Base address for display: 0x10040000 (heap)

Make sure to press “Connect to MIPS” before executing the program.

How to Play:
You will play against a computer. Each circle corresponds to an index (1-21) starting from the top circle then increasing downwards from left to right. Type your index number in the Run I/O console when prompted and press enter. If you input an invalid integer (too small/big, occupied circle), the prompt will repeat. The computer will choose a circle after you have chosen a circle (user is blue, computer is red). This will repeat until all circles except one have been occupied. A message will be displayed depending if you win or lose.
